

2026 Evil Swerve Drive Todo

File	Todo
AutoSystem	Does not compile. Replace with generic Exception instead of FileNotFoundException.
AutoRoutine	set class variable with value of autoDescription parameter..
AutoRoutine	set class variable with value of autoDescription parameter.. (2 nd constructor)
AutoSystem	Add private static HashMap to store all trajectories <String,Trajectory<SwerveSample>
AutoSystem	Add your newRoutine to the arrayList routines...
AutoSystem	Add your newRoutine to the class variable to be created containing the HashMap
AutoSystem	If you store the routines in the class variable containing the HashMap, then this routine doesn't need to return anything (void)
AutoSystem	Add a function to return an AutoRoutine from the hashmap with a calling String parameter of the name (file name without extension)
AutoSystem	Add call to TrajectorySystem.FollowTrajectory
IntakeSystem	Use built in spark max encoder. We are no longer getting a through bore encoder..
IntakeSystem	Encoder definition isnt correct.. Now use spark max built in encoder .GetEncoder(); see above.
IntakeSystem	limit switch is new wired to roboRIO... so this won't work. Use digital input.. Need to define object (class level), create object(in init function), read object (here).
TrajectorySystem	add calculate of "complete" and return "complete" to user. complete = elapsedtime >= trajectory time length AND onTarget.
TurretLauncher	get the values of the goal position based on alliance. I think there is a spreadsheet in slack. For now just use RED target.
TurretLauncher	This will not be throughbore encoder any longer. Use built in SparkMax encoder....
TurretLauncher	Use spark max built in encoder instead. Build didn't mount through bore encoder....
TurretLauncher	getPosition can be used above....
TurretLauncher	Add speed control for launcher. One PID will create output value for both motors. Add motors, Add sparkmax encoders, create average velocity, add simple motor feedforward and PID. (see swervemodule drive controller.)
AgitatorSystem	Set motor CAN Id
AutoFunctions	Add new java file for static Auto processing functions.
AutoFunctions	Add AutoFunctions.java file for static functions. Add an boolean AutoWait() function. It should set drive demand to zero and return false..
AutoSystem	Add call to AutoFunctions.AutoWait().
AutoSystem	add locNTSend trigger update.
AutoSystem	Add items to NT tables for debugging and watching autos. Suggest Step, Timeout, Parm1, Parm2, Parm3, Function. Add public getters for these.
FeederSystem	Set feeder motor CAN ID

Sheet1

SwerveTeleop	Add a driver button to execute a trajectory while button is held done. When first pressed (edge triggered) set init variable in call to follow trajectory.
SwerveVision	will have to set physical camera offset position once it is known. There is a spreadsheet in programming slack channel.
TrajectorySystem	add network table entries for ontarget, done, hasesample, timelengthoftrajectory (rename if you don't like name)
TrajectorySystem	TODO: add getters for new things written to network tables. ontarget, hasesample,done.
TurretLauncher	TODO: Set CAN ID
AgitatorSystem	Remove unused imports
AutoRoutine	Remove unused imports
Climb	Do the TODO... We don't know what climb is yet.
FeederSystem	Remove unused imports.
FeederSystem	Might need to do speed control here...
IntakeSystem	determine up and down angles on the robot -- suggest starting with 90 is up and 0 is down...
IntakeSystem	Say which motor is arm and which is intake.... Is 1 intake, and 2 arm ??
IntakeSystem	config values need to be changed/tuned
IntakeSystem	This appears to be redundant.
IntakeSystem	Is this intake or arm motor ????
IntakeSystem	what is this for? Maybe check the actual angle -- encoderRot -- instead.
SwerveDrive	Remove unused imports
SwerveModule	Remove unused imports
SwerveOdometry	put some comments here. For example, this is the initial robot position (pose)
SwerveTeleop	Remove old commented out things that will never be used.
SwerveTeleop	Add driver button box ???
SwerveTeleop	Add aux button box ???
TrajectorySystem	Remove unused imports.
TurretLauncher	Remove unused imports
AgitatorSystem	Add JavaDoc
AutoRoutine	Add JavaDoc
AutoStep	Suggest adding the following Cmd -- ExecuteCmd (command name is in Function string variable)
AutoStep	Suggest adding the following Cmd -- ExecuteCheckFor (command name is in function string variable)
AutoStep	Suggest adding the following Cmd -- AutoDone -- This will do nothing forever....similar to wait but with a forever timeout...
AutoStep	Add JavaDoc
AutoSystem	Add doc -- call this just prior to running ANY auto... Robot.java has a place for this. It isn't the overall just once init.
